Vol 6, Issue 6 **Yale Drills 9.2m of 0.51 g/t Au & 96.5 g/t Ag – Confirms Bulk Tonnage Potential** **July 1/08**

Yale Resources Ltd. (TSX-V: YLL) Assays Confirm Potential to Delineate Bulk Tonnage Gold-Siler Deposit

"We have an important mineralized system at Cero Colorado" - Quote Dr. Craig Gibson, P. Geo, VP of JV partner Exmin

Greg Thompson
Precious Metals Review

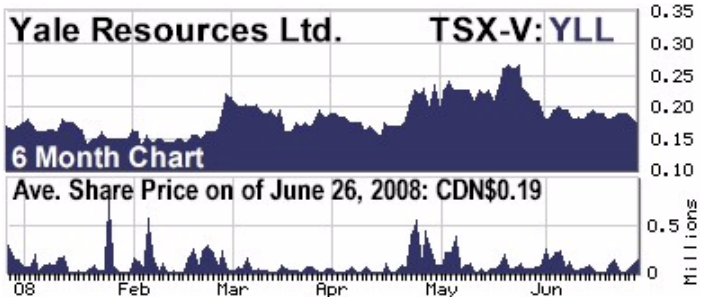
Potential New Discoveries Coming to Fruition

Yale Resources Ltd.'s recent 1,500m drill campaign at Cerro Colorado project on their Urique property successfully intersected target breccia over widths of several meters and covered a 2 km strike length at depths of 10 to approximately 150 meters. Assays released June 26th (see release *"Yale Drills 9.2 m of 0.51 g/t Au and 96.5 g/t Ag at Cerro Colorado")* confirm company geologist beliefs that the historic Mina Guadalupe and El Vergel mines are along the same main structure which suggests potential to delineate a bulk tonnage silver gold deposit. Assays returned impressive silver and gold grades including 4.6 meters with 0.98 grams per metric ton (g/t) gold and 162.2 g/t silver within a wider 9.2 meter interval with 0.51 g/t gold and 96.5 g/t silver. Company geologist are extremely encouraged by the results and believe there is the possibility for there to be a clavo or ore shoot at several locations along the 2.5km strike length of the system.

Additionally Yale has identified numerous quality targets on the Urique Project including the El Rosario target, which sampling yielded significant values as much 10.6 g/t gold and an astounding 8,290 g/t silver from a 10-40 cm wide veins.

The Urique Project is in close proximity to neighbouring large established resource laden gold and silver projects that share the same stratigraphy located in the highly prolific Sierra Madre Gold Belt, bordering Goldcorp's El Sauzal Mine (2.1M oz Au) to the south and Kimber Resources' Monterde Mine (0.8M oz Au, 45M oz Ag) to the north, each relating to large mineralized hydrothermal systems that have the potential to host bulk mineable resources. Numerous plus-one million ounce gold deposits have been discovered in this 300 km long region of Mexico: including Mulatos (Alamos Gold), Dolores (Minefinders), Ocampo (Gammon Lake), Pino Altos (Agnico Eagle), as well as Palmarejo (Couer D'Alene-recently purchased for one billion dollars).

Yale Resources also has other key projects in Mexico including their 100% owned La Verde Project which hosts six known historical deposits of copper, silver, zinc and gold that have seen limited production. The largest is Yale's La Verde Grande Mine site where Yale's 2007 geological mapping and sampling program has shown the deposit to be larger than historic data indicated. Yale has averaged 1.54% copper, 57.9 g/t silver, 1.32% zinc and .12 g/t Au from 181 samples taken over 500 meters of workings; YLL has duplicated old assay results with great success in various areas of La Verde, currently has geologists in the field conducting ongoing geological mapping and sampling, and believes the potential exists for a multi-million tonne Ag-Au-Cu-Zn open-pit mine; affirming results released June 19, 2008 confirm this "Yale Samples 13.3 Vertical Metres of 1.04 % Cu, 36.9 g/t Ag, and 0.61 % Zn within La Verde Grande Mine, Sonora, Mexico".



Under the Radar & Undervalued; Yale possesses near term copper production potential at La Verde & impressive gold-silver grades at Urique. With less than 40M shares issued and trading under CDN$0.20, the current market cap of YLL.V relative to its portfolio of highly prospective advancing projects makes Yale Resources an exceptional risk-reward scenario.
